The LogiMod was developed to be a free add-on for the popular project to talk (command line audio player). The LogiMod is an extremely versatile yet easy to use audio modul that allows you to add effects to your music files. Don't let the name confuse you, it's not a modulo that makes this free add-on, you can call it what you want, a simple music enhancement system, or a dummy module that does not do anything at all. The audio modules are shortcuts (exes) and they won't reside in your system. The most simple audio modul is a no-nonsense one that just records your music and saves it to a new file with the extension of .wav. It doesn't have any effects at all, but it does save your music in a standard format that's easy to edit on other softwares. One of the more complex audio modules has quite a few options in the dialogue box, which will allow you to browse through the options when you need to. Even though you could think of this as being confusing, we would advise against doing that. Other features of this audio modul include looping, the ability to get and save to different bitrates and file sizes, fade in/fade out, set equalizer settings and more. Currently there are 6 audio moduls available for download, and while they're not all free, they can be used to manipulate your files. You can download them all in a simple zip archive, so you shouldn't have to worry about anything except for installing them correctly. Let's see if we can demystify this free audio modul.
