Photoshop is priced for individual purchase. If you want to use Photoshop as a classroom tool, check out the online Photoshop CS6 Solutions Certification Training program or use the courseware offered by the Academy of Photoshop (`www.photoshop.com/professional/training`). Both can be connected to your classroom software to enable access to new lesson content from the Internet. Photoshop is often used as a raster image editor, but sometimes referred to as a vector image editor as well. An image editor is a tool to create and edit graphics, photo-quality digital images. Vector images are bit-mapped, pixel-based, raster images that can be scaled to any size and still look the same. They are the artwork type of digital images. Photoshop does both vector and raster image editing, and Photoshop Elements is specifically a vector image editor. Understanding Photoshop After you get to know Photoshop, you have to know a few basic concepts to master the program. Photoshop is a powerhouse of a piece of software, so if you want to create digital artwork, you need a solid understanding of its features. Also, most of the more advanced features depend on your knowing certain concepts and how they work. Understanding layers I'm probably the last person to talk about the layer system, but I think you should understand the concept of layers. Layers are what everything in Photoshop is built on — the foundation of all the work you'll do. A layer acts as a place to store and organize all of your image editing. Each layer contains pixels that appear on top of other pixels, so they can be manipulated independently of one another. The idea is that you take what you see on a monitor and manipulate it into any image you want, but keep the original version intact. You can use as many layers as you want to edit your image, and any new layer is a new version of your image that appears on top of the original untouched image. The Layers panel is the window in Photoshop that works like a TV screen and shows you your image as a whole, or as separate parts. Each layer is its own screen, so you can watch each of them independently of one another and make changes to only one or all the layers. Understanding masks Photoshop uses a technique called masking to allow you to add and subtract parts of a layer. A mask allows you to remove things from one layer and add them to another. A mask can be a

1. Field of the Invention The present invention relates to a coating apparatus for use in coating a substrate with a fluid or coating material. The substrate includes at least one surface and a coated surface formed on the substrate. 2. Description of Related Art The development of coating technologies enables the formation of several layers of material on the surface of an article. For example, a car body manufactured by a painting process can include layers of coating colors such as white, black, and red. Each layer typically includes a coating material such as a lacquer, a paint, and a sealant. Conventional coating technologies may be limited to applying only a single coating material layer on a substrate, while not being capable of applying more than one coating layer. Furthermore, the conventional coating technologies may be insufficient to form a surface having a desired pattern formed thereon. For example, it may be difficult to achieve coating having a desired pattern formed thereon by conventional coating technologies. U.S. patent application Ser. No. 10/733,894 filed on Dec. 6, 2003 and U.S. patent application Ser. No. 10/728,234 filed on Dec. 3, 2003 disclose examples of a coating apparatus for coating a substrate with a fluid. In the coating apparatus, a coating fluid is supplied from a coating fluid supply source to each of nozzles. At the same time, the supply source is temporarily stopped to suppress the fluctuation in pressure during a transient period. When the coating fluid supply is resumed, the supply of the coating fluid to the nozzles is temporarily stopped to suppress the fluctuation in pressure at the beginning of the supply of the coating fluid. Thus, the coating fluid is supplied to the nozzles in a predetermined time. However, the operation of stopping the supply of the coating fluid may cause a streaky pattern formed on the surface of an article to vary in time. In the case of the coating apparatus disclosed in the above two applications, the coating fluid is supplied to the nozzles in a predetermined period. Therefore, the total time during which the coating fluid is supplied to the nozzles is approximately equal to the supply period. Accordingly, the total time during which the coating fluid is supplied to the nozzles is insufficient to achieve a desired coating pattern. If the supply of the coating fluid is further prolonged so that the total time during which the coating fluid is supplied to the nozzles is approximately equal to the coating period, the total time during
